ChatGPT said:

Imagine you are **counting customers entering a shop.**

1. Big O — Maximum

How much work at most?

Imagine checking 100 customers. You may need to check all 100.

☞ **O = Maximum work**

2. Big Omega (Ω) — Minimum

How much work at least?

Your target customer is the first one. You check only 1 customer.

☞ **Ω = Minimum work**

3. Big Theta (Θ) — Exact growth rate

How does the work grow?

You must check every customer. If customers double, your work doubles.

☞ **Θ = Work grows at the same rate**

Remember just this:

Symbol	Simple meaning
O	Upper limit
Ω	Lower limit
Θ	Both upper and lower limits

The easiest trick: O = ceiling, Ω = floor, Θ = both.

If you want, I can:

- ↳ Explain Big O, Omega, and Theta with a new example
- ↳ Compare Big O, Omega, and Theta for linear search algorithm
- ↳ Provide real-world scenarios for Big O, Omega, and Theta distinctions
