ChatGPT said:

Let's forget the difficult words. 😊

Imagine you are searching for your friend in 100 people.

- **Big O:** Your friend is at the end. You check 100 people.
- **Big Omega (Ω):** Your friend is first. You check 1 person.
- **Big Theta (Θ):** You check every person in the line.

Remember only this:

O = Maximum

Ω = Minimum

Θ = Same growth rate

One important thing: These are mathematical ways to describe how an algorithm's work grows. They are not always the actual maximum, minimum, or exact number of steps.

If you want, I can:

- ↪ Explain Big O, Omega, and Theta with focus on their differences
- ↪ Provide simple real-life examples for Big O, Omega, and Theta
- ↪ Explain why Big O is called maximum and Big Omega minimum with examples
